

Supplementary Fig. 1. Comparison of abdominal computed tomography (CT) findings at the first visit and 24 months later. (A) Initial abdominal CT showing multiple cirrhotic nodules in both lobes. (B) Abdominal CT 24 months later, showing innumerable and scattered low-attenuation lesions in the liver parenchyma, spleen, and both kidneys, and multiple small lymph nodes at the lower paraesophageal, perigastric, portocaval, retrocaval, paraaortic, retroperitoneal, liver hilum, hepatoduodenal ligament, common hepatic artery, and celiac axis areas. (C) Chest CT 24 months later, showing innumerable small nodules with perilymphatic distribution in the right upper and left lower lung.
